1 INTRODUCTION

This report describes the drilling of seven temporary groundwater monitoring wells (TWM-10 through 16) at the Boeing Realty Corporation (BRC) C-6 facility ("Facility"), presents preliminary results from the sampling and analyses of borehole soils, and groundwater sampling results from 27 groundwater monitoring wells. The work was done as described in the June 1, 1998 letter "Revision 2 to Technical Work Plan," sent to Mr. James E. Ross of the California Regional Water Quality Control Board, Los Angeles Region (RWQCB). The June 1, 1998 revision was submitted to address comments in the May 20, 1998 letter from Mr. Ross to Mr. Chris Stoker of Integrated Environmental Services, Inc. (RWQCB File No. 100.315. See Appendix A.)

The "Facility" is located at 19503 South Normandie Avenue in Los Angeles. The "Facility" occupies approximately 170 acres, bounded on the north by 190th Street, on the east by Normandie Avenue, on the south by Montrose Chemical and residential properties, and on the west by Western Avenue, Capitol Metals, and the former International Light Metals facility (Figure 1).

The objective of the program described in the above correspondence was to obtain additional preliminary soils and groundwater information at locations primarily surrounding the outside of Building No. 2 on the east, south, and west. These locations had not been specifically explored in the previous site characterizations of the "Facility."

2 FIELD METHODS

This section of the report describes the methods and procedures used in the drilling of the temporary groundwater monitoring wells, soil sampling conducted during the drilling process, well construction, well development, groundwater sampling, and analyses. The work was in accordance with the June 1, 1999 "Revision 2 to Technical Work Plan" (Appendix A).

2.1 Drilling and Soil Sampling

Temporary groundwater monitoring wells were drilled at seven locations, designated TMW-10 through TMW-16 on Figure 2. All locations were selected in the field by a Kennedy/Jenks geologist and were checked for possible underground utilities by: 1) a records review, 2) Underground Service Alert (USA) clearance, and 3) geophysical screening. The wells were drilled from January 27 through February 4, 1999.

The drilling of each well was directed in the field by a Kennedy/Jenks geologist; either a California-registered geologist or an experienced geologist working under direction of a California-registered geologist. The geologists prepared boring logs in the field, based on observation of the drilling operation and examination of the soils in the recovered samples and in the auger cuttings. Soils were classified in the field according to the Unified Soil Classification System (USCS) and were recorded on Kennedy/Jenks' standard soil boring logs. Where soil descriptions changed between samples, the contact plotted on the finished logs is placed at the top of the lower sample unless the change was noted during drilling. The finished boring logs are attached in Appendix B.

The drilling contractor was West HazMat Drilling Corporation of Anaheim (License C57-554979). A truck-mounted CME-75 rig was used in this work. All the wells were drilled using 8-inch (nominal O.D.) hollow-stem augers. The CME dry core system was used in TMW-10, -12, -14, and -16 to obtain continuous soil samples from five feet to total depth of the boring.

Total depth of each boring was determined in the field based on the depth of water estimated by the field geologist from examination of the soil samples. Borings were continued to about 20 feet below the estimated water table.

Drive samples were collected during the drilling using a 2-inch I.D. "modified California" split-barrel sampler containing three 6-inch-long stainless steel insert tubes. The sampler was driven by a 140-pound down-hole slide hammer.

Drive samples were taken at nominal depths of 1, 5, 10, 20, 30, 40, and 50 feet below ground surface (bgs). To obtain a soil sample at the capillary fringe, closely-spaced drive samples were taken from several feet above the expected water table until wet soils were encountered. The 6-inch tube best indicating conditions at the capillary fringe was selected for laboratory analysis by the geologist from field examination of these samples. Sample depths, blow counts, and sample recovery are recorded on the boring logs in Appendix B.

The recovered soil samples were divided into three parts. Two parts of each sample were processed for laboratory analyses and field testing, and the remainder was used by the geologist for soil classification.

One 6-inch stainless steel tube was covered with Teflon™ liners and sealed with tight-fitting plastic, end caps and silicone tape, and was stored in an iced cooler for transfer to the analytical laboratory. This typically was the bottom tube, but others were used where needed to provide an intact, undisturbed sample for testing. The intervals tested are indicated on the boring logs in Appendix B. The samples were transferred under chain-of-custody to Orange Coast Analytical, Inc. of Tustin, California (a state-certified laboratory) at the end of each day. These soil samples were analyzed by the following methods, as specified in the work plan:

- Volatile organic compounds (VOCs) by EPA Method 8260
- TPH by EPA Method 8015 for gasoline and diesel
- Semivolatile organic compounds (SVOCs) by EPA Method 8270
- Pesticides by EPA Method 8080
- Title 22 metals by EPA Methods 6010, 7196, and 7471

Laboratory reports from the soil analyses are presented in Appendix C.

A part of each sample was used for field headspace testing. This soil was placed in a ziplock-type polyethylene bag, sealed, and left for several minutes to allow possible organic vapors to be released from the soil and contained in the bag. The headspace in the bag then was tested with a photo-ionization detector (PID) to provide a qualitative measure of the organic vapors in the soil sample. Headspace readings are recorded on the boring logs. The PID also was used to check the drill cuttings and air in the workers' breathing space during drilling for organic vapors.

Soil cuttings were stockpiled at a designated location on the "Facility." The soil stockpiles were placed on a layer of plastic sheeting and covered with plastic sheeting. Soil from each boring was stockpiled separately. Following receipt of laboratory results, clean soil stockpiles were used for backfill onsite and hazardous soils were manifested by BRC and disposed of at an appropriate offsite facility.

Augers, samplers, and other equipment contacting the in-place soils were decontaminated before each use. The augers were decontaminated by steam cleaning. Samplers were decontaminated by washing in a solution of Alconox (or an equivalent) in clean water, and then rinsing with 1) clean water and 2) distilled water. The water from decontamination was contained in Department of Transportation (DOT) 17H/17E drums that were marked accordingly and stored at a designated location on the "Facility".

Well Installation

A temporary groundwater monitoring well was constructed in each borehole promptly after drilling was completed. The wells were constructed of 2-inch Schedule 40 PVC casing and screen; typical construction is shown in Figure 3 and well construction details are summarized in Table 1.

The slot size and sand pack used for well construction were selected to be compatible with the soils in the well completion interval. The continuous dry core samples from TMW-10, -12, -14, and -16 showed that soils in the well completion intervals were predominantly fine silty sand and fine sandy silt. Due to the high percentage of fines in these soils, it was

necessary to use the well screen with the smallest slots available (0.010-inch) and the compatible sand pack (Lone Star #2/12).

Wells were installed through the hollow stem augers. Each well was constructed with 20 feet of 0.010-slot screen. The screen and casing were suspended in the borehole so that 15 feet of screen was below the estimated water table. A sand pack of Lone Star No. 2/12 sand was placed around the screen as the augers were retracted. Sand was placed to about two feet above top of the screen. During surging, sand was added as needed to keep the top of the filter pack about two feet above the screen. The well was then surged until the sand pack showed no further settlement.

A minimum two-foot layer of medium bentonite chips was placed as a sanitary seal above the sand pack. The bentonite was hydrated in place with clean water. The volumes of water used to hydrate the bentonite seal were recorded on the field logs.

The annulus of each well was filled with neat cement grout from top of the bentonite seal to just below ground surface. This grout was prepared with Type I – II Portland cement that was mixed at the surface using clean water from the on-site water service.

Five of the wells (TMW-10 through TMW-13 and TMW-16) are in paved areas and were completed at the surface with flush-mounted well covers (Figure 3). These covers were set in concrete so as to be slightly higher than the surrounding pavement, and thereby to prevent water from ponding above the well. These wells were locked with Morrison compression well plugs and matching padlocks. The two wells in unpaved areas (TMW-14 and TMW-15) were completed at the surface with aboveground locking steel casings, set on concrete pads.

2.2 Well Development

The temporary groundwater monitoring wells were developed no sooner than 48 hours after installation. Wells TMW-10 through 16 were developed on February 5 through 9, 1999. The well development records are attached in Appendix D.

Water levels and total well depths were sounded before beginning development. The wells were then surged and bailed using a cable winch system mounted on a sampling van. Surging was completed using a rubber disk mounted on the end of a steel rod. Bailing was performed using a 10-foot long stainless steel bailer.

The bailer and the part of the hoist cable that could contact the well water were decontaminated by steam cleaning before use in each well. The water from decontamination and the water bailed from the wells was contained in DOT 17H/17E drums that were marked accordingly, stored at a designated location on the "Facility," and appropriately manifested by BRC and disposed offsite based on laboratory results.

As specified in the work plan, the volume of water removed from the wells during development was at least the sum of: 1) three wetted casing volumes, and 2) three times the volume of water added during drilling and well construction. The total purge volumes ranged from 38 to 55 gallons and averaged 45 gallons. Well development was continued until consecutive measurements of the field parameters temperature, specific conductance, and pH had stabilized to within 10% of previous readings.

2.3 Groundwater Sampling and Analysis

Groundwater samples were collected from the temporary monitoring wells no sooner than seven days after well development. Wells TMW-10 through TMW-16 were sampled on March 3 - 6, 1999. Field data were recorded on the standard groundwater monitoring forms (Appendix E).

Before purging and sampling each well, depths to water were measured to within 0.01 foot using an electronic water level meter. A complete round of groundwater level measurements was made on April 8, 1999 and included all TMW wells, accessible WCC wells and DAC-P1. The April 8, 1999 water levels are summarized in Table 2 and were used to prepare the groundwater elevation contour map in Figure 4.

The wells were purged and sampled using a Grundfos RediFlo2 pump and single-use polyethylene tubing. The pump, motor lead, safety cable, and tubing were decontaminated before use in each well. The exterior of the pump and the other equipment contacting the well water were washed with a solution of Liquinox in clean water, rinsed with clean water, and then rinsed with distilled water. The pump, with tubing attached, then was placed in a solution of Liquinox in clean water and was run for several minutes to clean the interior of the pump and tubing. The pump then was rinsed by circulating clean water for several minutes. For a second rinse, at least 2.5 gallons of distilled water were pumped through the pump and tubing.

The pump was set at a nominal depth of 75 feet for purging and sampling in each well. The wells were purged of at least three wetted casing volumes by pumping at a slow rate, typically not exceeding 0.5 gallons per minute. Samples of the purged water were tested periodically for the field parameters of temperature, specific conductance, pH, and turbidity. Purging was continued until at least two consecutive measurements of the field parameters, temperature, specific conductance, and pH had stabilized to within 10% of previous readings.

After the purging was completed, the pumping rate was slowed to a rate suitable for filling sample containers, and samples were collected for the parameters specified in the work plan:

- VOCs by EPA Method 8260
- TPH by EPA Method 8015 for gasoline and diesel
- SVOCs by EPA Method 8270
- Pesticides by EPA Method 8080
- Title 22 metals by EPA Methods 6010 and 7471
- Hexavalent chromium (if total chromium exceeded 0.1 mg/l) by EPA Method 7196.

The samples were collected in order of decreasing volatility, per the EPA Technical Enforcement Guidance Document (EPA, 1986) and as listed above. The samples for metals analyses were filtered in the field using Gelman 0.45 µm in-line filter capsules.

One additional measurement of field parameters was made after the samples were collected. After all sampling and field measurements were completed, the pump was removed from the well and the polyethylene tubing and filter capsules were discarded. Water from the decontamination and well purging was contained in DOT 17H/17E drums

that were marked accordingly, stored at a designated location at the "Facility," and appropriately manifested by BRC and disposed offsite based on laboratory results.

The groundwater samples were placed promptly in an iced cooler. The samples were transferred under chain-of-custody to Orange Coast Analytical, a state-certified laboratory, at the end of each day. Laboratory reports from the groundwater analyses are in Appendix F.

2.4 Quality Assurance

Blank and duplicate samples were used for field quality assurance. One travel blank was used with each set of samples. The travel blank is a vial of contaminant-free water that was prepared by the laboratory and transported with the samples. The travel blank was analyzed by EPA Method 8260 as a check on possible contamination of the samples by contact with volatile organic compounds during transport, storage, or handling. No compounds were detected in these samples.

Equipment rinsate blanks were used as a check on decontamination of the sampling equipment. During the drilling and soil sampling, rinsate blanks were prepared by pouring distilled water over and through a sample barrel, with insert tubes, after it had been decontaminated for use. The water was collected directly in a 40-ml VOA vial and tested for VOCs by EPA Method 8260. The rinsate blank was collected on March 6, 1999 after sampling TMW-2 and decontamination.

One duplicate groundwater sample was collected during the sampling of WCC-3D on March 5, 1999. The duplicate sample was analyzed for all the specified groundwater parameters as a check on sampling and analytical precision. This additional set of sample bottles was filled along with the primary sample, following the same procedures and order. Results from the duplicate samples were in close agreement with the corresponding groundwater sample.

3 HYDROGEOLOGIC SETTING

This section provides a brief summary of regional and local geology and hydrogeology.

3.1 Regional Hydrogeology

The geology and hydrogeology of the region surrounding the "Facility" were determined mainly from reference to reports published by the U.S. Geological Survey (USGS) (Poland and others, 1959) and the California Department of Water Resources (DWR), (1961). Reference also was made to previous reports prepared by Kennedy/Jenks for the "Facility."

The "Facility" is located on a broad plain at an elevation of approximately 50 feet MSL. The DWR and USGS define this area as the Torrance Plain, a Pleistocene-age marine surface and a subdivision of the Coastal Plain of Los Angeles and Orange Counties. The ground surface in this area is generally flat with an eastward gradient of about 20 feet per mile (less than one-half percent). Surface drainage is generally toward the Dominguez Channel, about a mile to the east. The Dominguez Channel, in turn, flows southeastward toward the Los Angeles and Long Beach Harbors in San Pedro Bay.

The surface sediments in this area are assigned to the Lakewood Formation (DWR, 1961), a unit defined to include essentially all of the upper Pleistocene sediments in the Los Angeles Coastal Plain area. The Lakewood Formation includes deposits of both marine and continental origin, representing stream transport and sedimentation along the Pleistocene marine plain. In the "Facility" area, the Lakewood Formation may include the Semiperched Aquifer, the Bellflower Aquiclude, and the Gage Aquifer. The Semiperched Aquifer includes deposits described as Terrace Cover (Poland et. al., 1959). Extent and thickness of this unit is not rigorously defined, but appears to include the near-surface water-bearing units in the area of the "Facility." The Bellflower Aquiclude is described as a heterogeneous mixture of continental, marine, and wind-blown sediments, mainly consisting of clays with sandy and gravelly lenses (DWR, 1961). The base of the Bellflower Aquiclude is about 100 feet below sea level (about 150 feet bgs) in the "Facility" area. The Gage Aquifer is a water-bearing zone of fine to medium sand and gravel confined by the Bellflower Aquiclude. It is reported to be about 40 feet thick in the "Facility" area and is described as being of secondary importance as a water source (DWR, 1961).

The Lakewood Formation is underlain by the Lower Pleistocene San Pedro Formation, which continues to about 1,000 feet in depth in the "Facility" area. Major water-bearing zones within the San Pedro Formation are the Lynwood Aquifer and the Silverado Aquifer. These are reported to be at depths of about 300 and 500 feet, respectively, in the "Facility" area (DWR, 1961). The Silverado is an important groundwater source in the Coastal Plain and is considered a source of drinking water (DWR, 1961).

3.2 Groundwater at the "Facility"

The uppermost groundwater at the "Facility" appears to be under water-table conditions at depths of 60 to 70 feet. Regionally, this uppermost groundwater is probably considered part of the Semiperched Aquifer discussed previously and is separated from the deeper zones by the Bellflower Aquiclude (Kennedy/Jenks, 1997b).

Monitoring wells at the "Facility" are completed in two zones. Most of the wells are completed at or near the semi-perched aquifer, with screened intervals ranging from 60 to

90 feet bgs. Two deeper wells, WCC-1D and WCC-3D, were completed in a deeper zone with screened intervals from 120 to 140 feet bgs (Woodward-Clyde Consultants, 1990). One well, WCC-1D, has been abandoned.

Records of water-level measurements are included in the quarterly Groundwater Monitoring Summary Reports (Kennedy/Jenks, January 1997b). The hydraulic gradient in the uppermost groundwater is generally toward the south-southeast, toward a local low in the area of wells WCC-7S and WCC-12S.

Groundwater conditions at the "Facility" are known from previous investigations and from the quarterly groundwater monitoring program (Kennedy/Jenks, 1997b). Groundwater samples from monitoring wells at the "Facility" have been sampled and analyzed on a quarterly basis since 1992.

4 RESULTS

This section summarizes information obtained from drilling and sampling the temporary monitoring wells. Results of this program are discussed in four categories: 1) subsurface geology, 2) groundwater, 3) chemical constituents in soil, and 4) chemical constituents in groundwater.

4.1 Subsurface Geology

The drilling program for the seven temporary groundwater monitoring wells provided soils data on roughly 10-foot intervals to the water surface (around 64 to 66 feet bgs) and general descriptions to total depth of around 86 feet. In general, the new soils data was correlative with the previous soils data and the soils units Q1 through Q5.

- **Unit Q1:** Unit Q1 is a layer of silty clay and sandy clay encountered at the surface or just below the pavement or engineered fill soils over the entire "Facility." This clay is typically dark brown to dark reddish brown in color and medium stiff to hard. It has moderate to high plasticity and is classified as CL or CH under the Unified Soil Classification System (USCS). Unit Q1 has a uniform thickness of about 5 feet along the west side of the "Facility." It thickens to about 22 feet on the northeast corner of the "Facility," but only to about 10 feet in the east-central portion of the "Facility."
- **Unit Q2:** Unit Q2 comprises a sequence of interbedded clayey silt, fine sandy silt, and fine silty sand with minor lenses of silty clay. The predominant USCS classifications are ML, SM and SC and combinations of the three classifications. The Unit Q2 soils are brown and olive brown in color and are generally medium dense. Unit Q2 is about 17 to 20 feet thick and the base is about 22 to 25 feet bgs along the west side of the "Facility." The unit thickens to about 30 to 40 feet at the east side of the "Facility." The base of Unit Q2 also slopes eastward, and occurs at depths of 45 to 50 feet along the northeast side of the "Facility" and greater than 50 feet at the east-central portion of the "Facility."
- **Unit Q3:** Unit Q3 is an interval of fine and very fine sand with only minor silt. Soils in this interval generally are classified as SP and SP-SM under the USCS. This soil unit includes distinctive beds containing abundant shell fragments on the southwest. The sand is mainly light yellowish brown to light yellowish gray in color. It has generally massive structure, and commonly is described as being similar to beach sand. The sand is generally dense, but has essentially no cohesion. Unit Q3 is more than 25 feet thick on the west side of the "Facility," extending from about 20 feet bgs to below the 50-foot depth drilled at the northwest corner of the "Facility." However, in the southern part of the "Facility," Unit Q3 is interlayered with Unit Q4, a wedge of fine silty sand and fine sandy silt.
- **Unit Q4:** Unit Q4 was observed in borings in the southwestern and south-central part of the "Facility." It pinches out in the north-central part of the area and is likely below the depth drilled on the east. Maximum thickness of this soil unit is about 17 feet, on the southwest. Unit Q4 mainly contains fine silty sand (SM) and clayey silt (ML) with thin interbeds of silty clay and fine sand. These soils are generally yellowish brown in color and are medium dense to dense.

- **Unit Q5:** Unit Q5 is a layer of predominantly silty sand and sandy silt encountered below about 65 feet bgs. The predominant USCS classification is SM. Unit Q5 soils are typically olive brown in color and generally dense. The unit extends to the base of the drilled interval; therefore, no thickness measurements are possible. The top of Unit Q5 appears fairly consistent in a north-south direction, but tends to get deeper going from west to east.

4.2 Groundwater

Groundwater was encountered under water-table conditions at depths of 61 to 73 feet bgs in the TMW wells, the accessible WCC wells, and DAC-P1. The water levels are listed in Table 2. Figure 4 is a water-level contour map based on the complete round of water level measurements taken on April 8, 1999. The contours in Figure 4 indicate a quite flat hydraulic gradient toward the southeast at 0.001 ft/ft (5 feet per mile). This gradient is similar to that determined from previous water-level measurements at the "Facility" (e.g., Kennedy/Jenks, 1997b and 1999).

4.3 Chemical Constituents in Soil

The soil samples were analyzed for the following parameters:

- VOCs by EPA Method 8260
- TPH by EPA Method 8015 for gasoline and diesel
- SVOCs by EPA Method 8270
- Pesticides by EPA Method 8080
- Title 22 metals by EPA Methods 6010 and 7471
- Hexavalent chromium (if total chromium exceeded 0.1 mg/kg) by EPA Method 7196.

The laboratory reports for soils analyses are included in Appendix C. A summary of analytical detections is presented on Table 3. Extractable (TPHd) and volatile (TPHg) petroleum hydrocarbons were not detected in any of the 52 soil samples. One semi-volatile organic compound was detected in only one soil sample; diethylphthalate in TMW-12 at 40 feet bgs.

Two locations, TMW-11 and TMW-15, had detections of pesticides in the samples from one-foot bgs. 4,4-DDD, 4,4-DDE and 4,4-DDT were detected at TMW-11 at 90, 130, and 65 µg/kg, respectively, and at TMW-15 at 2.2, 6.2, and 4.7 µg/kg, respectively.

VOCs were detected in 10 of the 52 soil samples. VOCs were not detected in TMW-10 and TMW-14. TMW-11 had one detection, 20 µg/kg of chloroform, in the capillary fringe sample taken at 63 feet bgs. TMW-13 also had one detection of chloroform, but not in the capillary sample. Chloroform was detected in TMW-13 at 3.0 µg/kg at 50 feet bgs. TMW-15 had one detection of VOCs, 3.0 µg/kg of TCE, at 55 feet bgs. TMW-16 had two detections of naphthalene, 3.1 µg/kg and 3.7 µg/kg, at 25 and 30 feet bgs, respectively. These data suggest there are no local sources of VOCs in the vicinities of TMW-10 through TMW-16.

Metals detected in the soil samples are summarized in Table 4. Metals detected in these soil samples were generally similar to those detected during previous monitoring events. Barium, chromium (total), cobalt, copper, nickel, vanadium, and zinc were detected in nearly

all the samples from the temporary monitoring wells, and were detected in all the samples from the previous exploration (Kennedy/Jenks, 1999).

Arsenic, beryllium, lead, and molybdenum were detected in most of the soil samples from temporary monitoring wells TMW-10 through TMW-16. This group of metals is similar to those detected in TMW-1 through TMW-9 soils, but the molybdenum is not. Arsenic was reported at generally low levels, mainly less than 9 mg/kg. These concentrations are within the typical natural range for soils (Table 5) and are substantially below the TTLC of 500 mg/kg. The arsenic concentrations also were generally uniform laterally and vertically in this area, indicating that the arsenic is most likely a natural constituent in these soils.

Beryllium was reported at very low concentrations, up to a maximum of 0.89 mg/kg. These concentrations are at the low end of the common range in soils (Table 5) and a small fraction of the TTLC. The beryllium concentrations also were generally uniform vertically and laterally, and appear to be a natural occurrence.

Lead was detected in all the soil samples at low concentrations, less than 8.6 mg/kg. These lead concentrations are at the low end of the common range in soils (Table 5) and do not approach the TTLC. The generally uniform concentrations of lead in these samples indicate that it is most likely a natural constituent in the soil.

Mercury was detected in soils from TMW-10 from 1 foot to 50 feet bgs at concentrations ranging from 0.14 µg/kg at 1-foot bgs to 0.45 µg/kg at 5 feet bgs. There was one detection of cadmium of 0.82 µg/kg in TMW-10 at 30 feet bgs. Molybdenum was detected once in TMW-10 at 10 feet bgs (1.2 µg/kg), once in TMW-11 at 40 feet bgs (1.1 µg/kg), once in TMW-13 at 20 feet bgs (1.0 µg/kg), and twice in TMW-15 at 25 feet bgs (1.1 µg/kg) and 71 feet bgs (1.5 µg/kg). Molybdenum was detected throughout the soil column in TMW-14 and TMW-16 with concentrations ranging from non-detect to 1.7 µg/kg. All of these metals were reported at levels much lower than the TTLC or 10 times the STLC.

4.4 Chemical Constituents in Groundwater

Groundwater samples from the temporary monitoring wells were analyzed for the parameters that were specified in the work plan:

- VOCs by EPA Method 8260
- TPH by EPA Method 8015 for gasoline and diesel
- SVOCs by EPA Method 8270
- Pesticides by EPA Method 8080
- Title 22 metals by EPA Methods 6010 and 7471
- Hexavalent chromium (if total chromium exceeded 0.1 mg/l) by EPA Method 7196

The groundwater laboratory reports are attached in Appendix F and the compounds detected are summarized in Table 6. Pesticides and extractable fuel hydrocarbons (TPH diesel) were not detected in any of the samples. SVOCs generally were not detected; only bis (2ethylhexyl) phthalate (a common plasticizer found in laboratory equipment) was reported in the samples from TMW-15 and TMW-16 at 5.5 and 6.2 µg/l, respectively. 2-Methylphenol, 4-methylphenol, and phenol were detected in WCC-3S at 12, 9.4, and 7.9 µg/l, respectively. Volatile fuel hydrocarbons (TPH gasoline) were reported in a majority of

the wells, ranging from 0.053 mg/l in WCC-11S to 60 mg/l in WCC-3S, and generally were higher in the samples having higher levels of VOCs. Results of the VOC and metals analyses for groundwater are discussed in the following subsections.

4.4.1 Volatile Organic Compounds in Groundwater

VOCs were detected in groundwater from all 16 TMW wells and the eight WCC wells sampled in March 1999, and in wells WCC-10S and DAC-P1 sampled in April 1999 (Table 5 and Figure 5). TCE and 1,1-DCE occurred at the highest concentrations. TCE was detected in all wells sampled. 1,1-DCE was detected in TMW-1 through 9, TMW-15, and all WCC wells.

The TCE and 1,1-DCE were also accompanied by the same related compounds, including cis-1,2-DCE, Trans-1,2-DCE, 1,2-DCA, and 1,1,1-TCA. These compounds were detected in differing combinations and proportions, indicating the possibility of originating from more than one source as suggested in the previous groundwater monitoring report for wells TMW-1 through 9 (Kennedy/Jenks, 1999).

The highest VOC concentrations were detected in groundwater from TMW-2 (Table 5 and Figure 5). As noted previously, this well is in an area where high levels of VOCs were reported in previous investigations. Groundwater from TMW-2 contained TCE and 1,1-DCE at 37,000 µg/l and 39,000 µg/l, respectively. The TMW-2 groundwater also contained chloroform (250 µg/l), 1,1-DCE (1,600), trans-1,2-DCE (600 µg/l), cis-1,2-DCE (660 µg/l), and 1,1,1-TCA (4,300 µg/l).

Analyses of groundwater from the TMW wells and WCC wells located southeast and east of TMW-2 detected the same group of compounds, although at lower concentrations. The samples from TMW-1, 4, 7, 8, and WCC-3S, 4S, 7S, 9S, 11S, and 12S all contained TCE and 1,1-DCE along with some or all of the following: trans-1,2-DCE, cis-1,2-DCE, 1,1,1-TCA, 1,1-DCA, and chloroform. Groundwater from these wells suggests a possible similarity in source.

VOC concentrations in nearby wells TMW-1 and TMW-9 were markedly lower than in TMW-2. TCE and 1,1-DCE in water from TMW-1 were only 320 and 330 µg/l, respectively. However, the water seems similar in character to that from TMW-2.

The samples from wells TMW-3, TMW-5, and TMW-6, in the west and south parts of Building 2, contained VOCs in different combinations than seen at well TMW-2. Water from TMW-3 and TMW-5 contained elevated TCE (8,200 and 4,500 µg/l) with much lower levels of 1,1-DCE (210 and 500 µg/l). The suite of additional VOCs associated with wells around TMW-2 was not present in wells in this area.

Chloroform was detected in many of the wells but seems concentrated along the south side of Building 2 with the highest concentration, 3,100 µg/l at TMW-12.

4.4.2 Metals in Groundwater

Barium, chromium (total), and zinc were detected in the majority of groundwater samples from the TMW wells, the accessible WCC wells, and DAC-P1 (Table 5). Copper, nickel, and vanadium were detected in TMW-15; vanadium was also detected in TMW-16; and

chromium (VI) was detected in TMW-2 and DAC-P1. The remaining Title 22 metals were not detected.

Barium was reported at 0.049 (TMW-5) to 0.40 (TMW-11) mg/l. These values are well below the drinking water standard of 1 mg/l. It is notable that barium concentrations were not unusually high in the capillary-fringe soil samples from these locations.

Chromium (total) was reported in 19 of the 27 groundwater samples at concentrations ranging from 0.010 (TMW-14) to 0.260 (TMW-2) mg/l. These values are all below the drinking water standard of 0.05 mg/l except at TMW-2. The groundwater from TMW-2 also contained hexavalent chromium at 0.22 mg/l. Hexavalent chromium was not detected in the soil sample from the capillary fringe in TMW-2, and total chromium concentrations were not unusually high.

Zinc was detected in the majority of groundwater samples ranging from 0.013 mg/l at WCC-7S to 0.058 mg/l at TMW-15. These values are a small fraction of the 5-mg/l drinking water standard.

5 SUMMARY

Seven new temporary groundwater monitoring wells were installed, developed and sampled in the area around the outside of building 1 on the "Facility." Soil samples were collected at intervals from one foot below the base of the surface covering to the capillary fringe at around 65 feet bgs during well installation. One round of groundwater samples was collected and analyzed during this investigation, and included all 16 TMW wells, 10 WCC wells and DAC-P1.

Overall, the soils and groundwater data are in good agreement with chemicals of concern and their distribution in the subsurface identified in previous characterization studies performed on the "Facility." The south-southeast groundwater flow direction and low gradient are also consistent with the results of previous investigations.

- TPH-gasoline and diesel were not detected in any of the 52 soil samples.
- One SVOC, diethylphthalate, was detected at 180 µg/kg in one soil sample from TMW-12 at 40 feet bgs.
- The pesticides 4,4-DDD, 4,4-DDE, and 4,4-DDT were detected in the one-foot bgs sample at TMW-11 at 90, 130, and 65 µg/kg and TMW-15 at 2.2, 6.2, and 4.7 µg/kg, respectively.
- TCE was only detected in one soil sample from TMW-15 in the 55-feet bgs sample at a concentration of 3.0 µg/kg.
- Chloroform was detected in one sample from TMW-11 and one sample from TMW-13. The highest concentration was 20 µg/kg.
- Metals detected in the soils were generally similar to the metals detected from previous extensive site investigations. Barium, chromium (total), cobalt, copper, nickel, vanadium, and zinc were detected in nearly all the soil samples, and at concentrations in about the same range as previously reported.
- In addition, arsenic, beryllium, and lead were detected in most of the soil samples from temporary monitoring wells TMW-10 through TMW-16 at concentrations, similar to those detected in TMW-1 through TMW-9. All were detected at low concentrations within the natural range for soils and are well below the appropriate TTLC levels, and are generally uniform vertically and laterally, suggesting a natural occurrence.
- Cadmium, mercury, and molybdenum were reported at low levels in a few soil samples. Mercury was detected throughout the soil column at TMW-10. There was one detection of cadmium in TMW-10 at 30 feet bgs. Molybdenum was detected once each in TMW-10, 11, and 13; twice in TMW-15; and throughout the soil column at TMW-14 and 16. All detections are slightly above the common range in soils but are at concentrations much lower than the TTLC or 10 times the STLC.
- The depth to first groundwater, the groundwater flow direction and the groundwater gradient are in accord with the previously determined direction and gradient from the existing onsite monitoring well network. Groundwater is first encountered between 61

and 73 feet bgs. The flow direction is approximately south-southeast with a relatively flat gradient of about 0.001 ft/ft (about 5 feet per mile).

- TPH-diesel and pesticides were not detected in any groundwater samples.
- TPH-gasoline was detected in a majority of the groundwater samples ranging from 0.053 mg/l at WCC-11S to 60 mg/l at WCC-3S.
- VOCs were detected in all groundwater samples. TCE and 1,1-DCE had the highest concentrations detected at TMW-2 at 39,000, and 36,000 µg/l, respectively. Detections of 1,1,1-TCA, cis-1,2-DCE, and trans-1,2-DCE were also associated with the TCE and 1,1-DCE. Many of the wells located south to east of TMW-2, including TMW-1, 4, 7, and 8, and WCC-3S, 4S, 7S, 9S, 11S, and 12S had similar distributions of related chemicals suggesting a single source area.
- Wells TMW-3, TMW-5, and TMW-6 and others along the west side of Building 2 contained VOCs, too, but in different combinations than at TMW-2. The concentrations of TCE was much higher than 1,1-DCE in these wells. The suite of additional VOCs associated with wells around TMW-2 was not present in the wells in this area.
- Chloroform was detected in many of the wells but seems concentrated along the south side of Building 2 with the highest concentration, 3,100 µg/l, at TMW-12.

Table Notes:

Blank cell indicates constituent result was below the detection limit.

Shaded cell indicates sample was not tested for the given constituent.

1. Detection limits varied between well samples for volatile organics analyses.

2. Detection limits were consistent between well samples for semivolatile organics, fuel hydrocarbons, and metals analyses.

3. Chromium (VI) analysis was performed only if total Chromium exceeded 0.10 mg/L.

Table shows only compounds that were detected at least once in the groundwater samples.

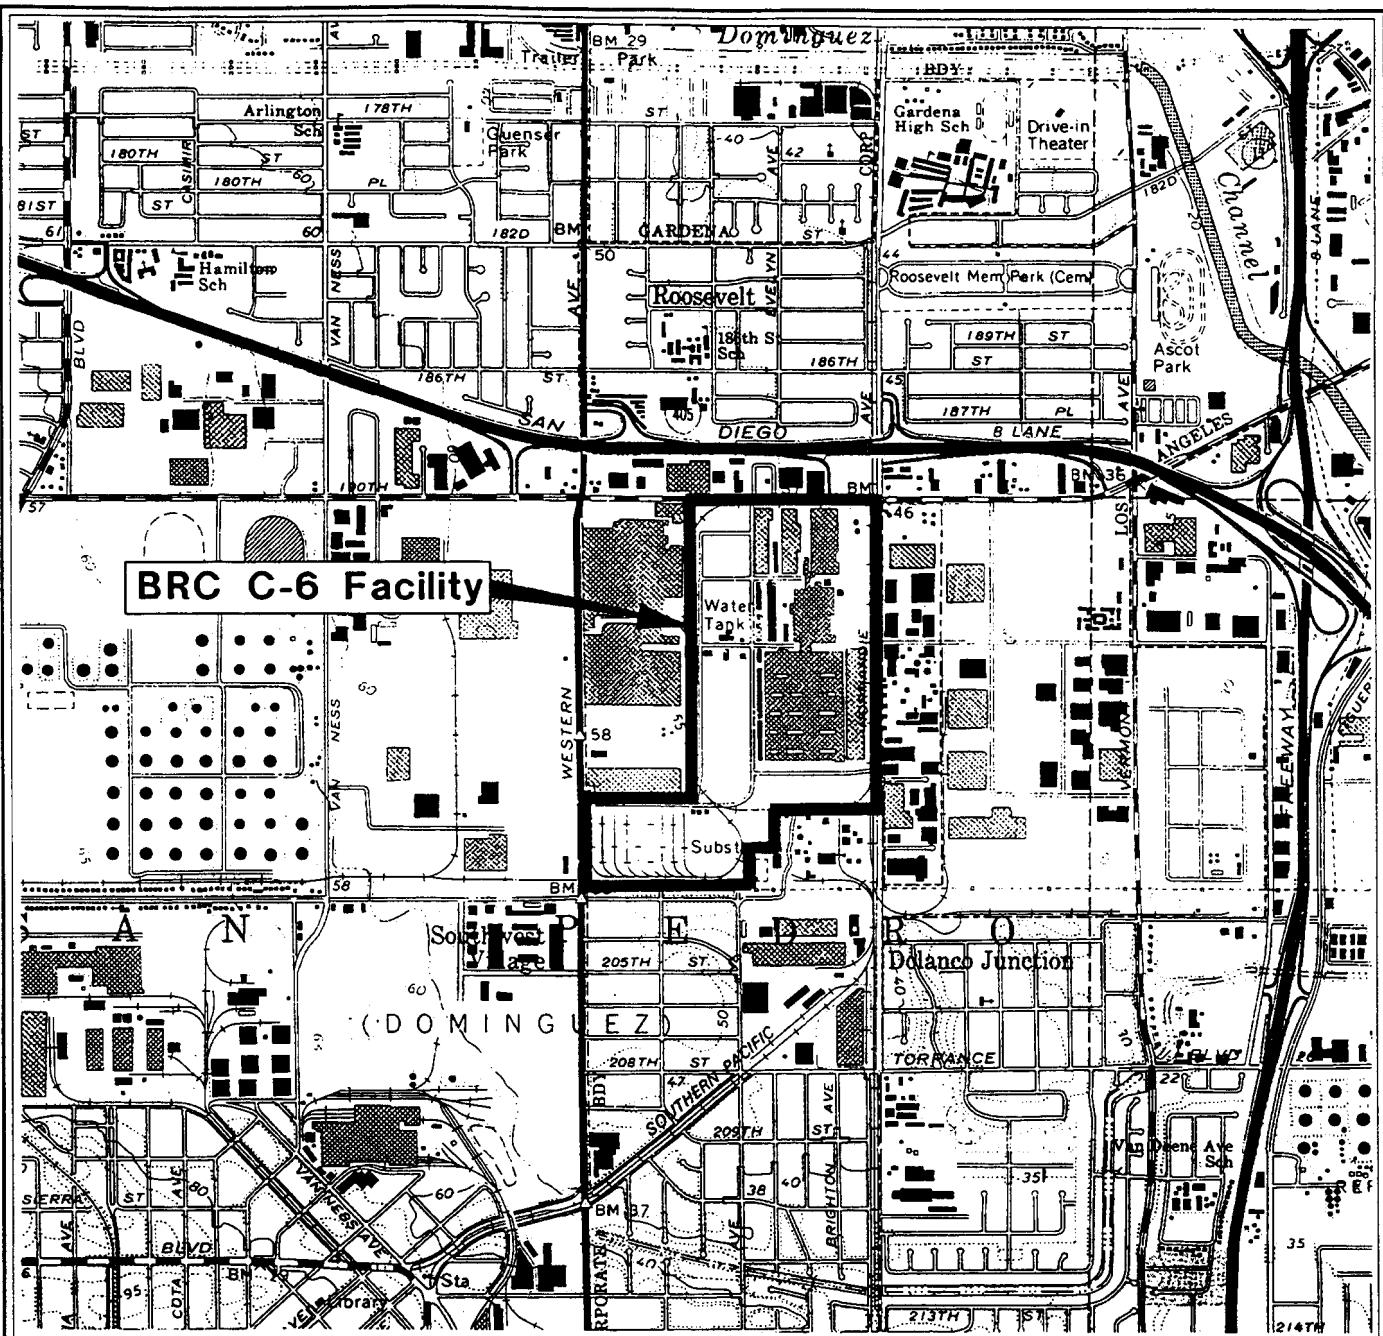

No detections were reported for total extractable petroleum hydrocarbons analysis (EPA 8015m).

No detections were reported for organochlorinated pesticides analysis (EPA 8080).

TECHNICAL WORKPLAN, INSTALLATION OF TEMPORARY GROUNDWATER
MONITORING WELLS - BOEING C-6 FACILITY, LOS ANGELES, CALIFORNIA
(FILE NO. 100.315)

We have received and reviewed your Technical Workplan, Installation of Temporary Groundwater Monitoring Wells - Boeing C-6 Facility, Los Angeles, California, dated April 20, 1998. Our comments are as follows:

- 1) Include a contingency plan to collect and analyze soil samples if visible contamination, odors or PID readings indicate that contamination is present. Samples should be analyzed for the same suite of chemicals for which the groundwater is being tested.
- 2) Collect and analyze a soil sample from the capillary fringe in each boring. Samples should be analyzed for the same suite of chemicals for which the groundwater is being tested.
- 3) The workplan indicates that the annulus above the bentonite sanitary seal will be left open. The annulus must be filled should visible contamination, odors or PID readings indicate that soil contamination is present.

Should you have any questions regarding the above, please contact Hugh Marley at (213) 266-7669.

J.E. ROSS, Unit Chief
Site Cleanup Unit

LABORATORY REPORT FORM

Laboratory Name: ORANGE COAST ANALYTICAL, INC.

Address: 3002 Dow Suite 532 Tustin, CA 92780

Telephone: (714) 832-0064

Laboratory Certification

(ELAP) No.: 1416 Expiration Date: 2001

Laboratory Director's Name (Print): Mark Noorani

Client: Kennedy Jenks Consultants

Project No.: Boeing C-6

Project Name: 994001.00

Laboratory Reference: KJC 10695

Analytical Method: 8260, 8270, 8015m gas, 8015m diesel, 8080 Pest, Title 22 metals

Date Sampled: 01/28/99

Date Received: 01/28/99

Date Reported: 02/05/99

Sample Matrix: Soil & Water

Chain of Custody Received: Yes

Laboratory Director's Signature: Mark Noorani

LABORATORY REPORT FORM

Laboratory Name: ORANGE COAST ANALYTICAL, INC.

Address: 3002 Dow Suite 532 Tustin, CA 92780

Telephone: (714) 832-0064

Laboratory Certification

(ELAP) No.: 1416 Expiration Date: 2001

Laboratory Director's Name (Print): Mark Noorani

Client: Kennedy Jenks Consultants

Project No.: Boeing C-6

Project Name: 994001.00

Laboratory Reference: KJC 10706

Analytical Method: 8260, 8270, 8015m gas, 8015m diesel, 8080 Pest, Title 22 metals

Date Sampled: 02/01/99

Date Received: 02/01/99

Date Reported: 02/08/99

Sample Matrix: Soil & Water

Chain of Custody Received: Yes

Laboratory Director's Signature: Mark Noorani

LABORATORY REPORT FORM

Laboratory Name: ORANGE COAST ANALYTICAL, INC.

Address: 3002 Dow Suite 532 Tustin, CA 92780

Telephone: (714) 832-0064

Laboratory Certification

(ELAP) No.: 1416 Expiration Date: 2001

Laboratory Director's Name (Print): Mark Noorani

Client: Kennedy Jenks Consultants

Project No.: Boeing C-6

Project Name: 994001.00

Laboratory Reference: KJC 10691

Analytical Method: 8260, 8270, 8015m gas, 8015m diesel, 8080 Pest, Title 22 metals

Date Sampled: 01/27/99

Date Received: 01/27/99

Date Reported: 02/02/99

Sample Matrix: Soil & Water

Chain of Custody Received: Yes

Laboratory Director's Signature: Mark Noorani

Kennedy Jenks Consultants

LABORATORY REPORT FORM

Laboratory Name: ORANGE COAST ANALYTICAL, INC.

Address: 3002 Dow Suite 532 Tustin, CA 92780

Telephone: (714) 832-0064

Laboratory Certification

(ELAP) No.: 1416 Expiration Date: 2001

Laboratory Director's Name (Print): Mark Noorani

Client: Kennedy Jenks Consultants

Project No.: Boeing C-6

Project Name: 994001.00

Laboratory Reference: KJC 10708

Analytical Method: 8260, 8270, 8015m gas, 8015m diesel, 8080 Pest, Title 22 metals

Date Sampled: 02/02/99

Date Received: 02/02/99

Date Reported: 02/05/99

Sample Matrix: Soil & Water

Chain of Custody Received: Yes

Laboratory Director's Signature: Mark Noorani

Kennedy Jenks Consultants

ATTN: Mr. Rus Purcel
 2151 Michelson Ave. Suite 100
 Irvine, CA. 92612

LABORATORY REPORT FORM

Laboratory Name: ORANGE COAST ANALYTICAL, INC.

Address: 3002 Dow Suite 532 Tustin, CA 92780

Telephone: (714) 832-0064

Laboratory Certification

(ELAP) No.: 1416 Expiration Date: 2001

Laboratory Director's Name (Print): Mark Noorani

Client: Kennedy Jenks Consultants

Project No.: Boeing C-6

Project Name: 994001.00

Laboratory Reference: KJC 10715

Analytical Method: 8260, 8270, 8015m gas, 8015m diesel, 8080 Pest, Title 22 metals

Date Sampled: 02/04/99

Date Received: 02/04/99

Date Reported: 02/11/99

Sample Matrix: Soil & Water

Chain of Custody Received: Yes

Laboratory Director's Signature: Mark Noorani

Kennedy Jenks Consultants

ATTN: Mr. Rus Purcell
 2151 Michelson Dr, Suite 100
 Irvine, CA 92612

Client Project ID: Boeing C-6
Client Project #: KJ994001.00

Sample Description: Soil,

Sampled: 02/04/99
Received: 02/04/99
Analyzed: 02/05/99
Reported: 02/11/99

Laboratory Reference #: KJC 10715

VOLATILE FUEL HYDROCARBONS (EPA 8015m)

LABORATORY REPORT FORM

Laboratory Name: ORANGE COAST ANALYTICAL, INC.

Address: 3002 Dow Suite 532 Tustin, CA 92780

Telephone: (714) 832-0064

Laboratory Certification

(ELAP) No.: 1416 Expiration Date: 2001

Laboratory Director's Name (Print): Mark Noorani

Client: Kennedy Jenks Consultants

Project No.: Boeing C-6

Project Name: 994001.00

Laboratory Reference: KJC 10705

Analytical Method: 8260, 8270, 8015m gas, 8015m diesel, 8080 Pest, Title 22 metals

Date Sampled: 01/29/99

Date Received: 01/29/99

Date Reported: 02/08/99

Sample Matrix: Soil & Water

Chain of Custody Received: Yes

Laboratory Director's Signature: Mark Noorani

Definition of Terms :

R1	Results Of First Analysis
SP	Spike Concentration Added to Sample
MS	Matrix Spike Results
MSD	Matrix Spike Duplicate Results
PR1	Percent Recovery Of MS: $\{(MS-R1) / SP\} \times 100$
PR2	Percent Recovery Of MSD: $\{(MSD-R1) / SP\} \times 100$
RPD	Relative Percent Difference: $\{(MS-MSD) / (MS+MSD)\} \times 100 \times 2$

QC DATA REPORT

Analysis : Metals

Date of Analysis : 02/01-03/00

Laboratory Sample No : 99010251

Laboratory Reference No : KJC 10705
